

HOW TO EDUCATE FUTURE GAME-CHANGERS?

Workshop on developing pedagogical experiments

What are the skills our students need in the 21st century? How to survive in the fast-changing world of today and tomorrow?

These are the questions we have been exploring during the past 10 years at Aalto Design Factory, an experimental platform for product development and co-creation, and the Design Factory Global Network. Come and join to learn what the Design Factory concept is about, how problem-based-learning is applied in the context of Design Factory, examples of course models and practices, and to develop your own teaching experiments.

Design Factory Global Network is a network of innovation platforms that drive change in their own institutions for a better learning culture, whether it is in a university or a research center. DFGN operates across the globe in five continents. All DFs in the network are built based on the development interests of the host institution. The shared ways of working and the supporting culture enable the collaboration in the network.
